

KISHAN KHODBHAYA

AI Automation Engineer & Python Backend Developer

Gandhinagar, Gujarat, India | +91 88498 14384 | khodbhaya1843@gmail.com | [LinkedIn](#) | [Portfolio](#) | [GitHub](#)

Professional Summary

AI Automation Engineer with 2+ years building multi-agent LLM workflows, n8n automation systems, and production-grade Python APIs. Experienced with US clients, team leadership, and RAG-based architectures. Daily user of Cursor and GitHub Copilot.

Core Skills

AI & Automation	n8n, Agentic Workflows, LLM Integration (Gemini, OpenAI, Anthropic), Prompt Engineering, RAG / Pinecone, Multi-Agent Systems, Tool/Function Calling Patterns
Backend Development	Python, Flask, REST APIs, JWT Authentication, Webhook Design, API Error Handling, Data Contracts
Frontend & Web	JavaScript (ES6+, async/await, REST API consumption), HTML5 (semantic), CSS3 (responsive layouts)
Data & Databases	MySQL, SQL Optimization, Schema Design, Indexing, Relational vs Non-Relational Trade-offs
DevOps & Tools	Git (branching, PRs, code reviews), Docker, Nginx, Ubuntu, systemd, Cloudflare
AI Coding Tools	Cursor, GitHub Copilot — integrated into daily development workflow
Automation Platforms	n8n (advanced), Selenium, Browser Use, Claude API (Anthropic)

Education

Master of Computer Applications (MCA)	LDRP Institute of Technology & Research	2022 – 2024
B.Sc. B.Ed. Mathematics	Indian Institute of Teacher Education	2018 – 2022

Professional Experience

AI Automation Engineer & Backend Developer — VedikIn Solutions *Jan 2024 – Nov 2025 — Gandhinagar, India*

- Designed and deployed AI-integrated automation workflows in n8n connecting APIs, databases, and external systems with conditional logic, retries, and structured error handling.
- Engineered 20+ REST APIs using Python/Flask and JWT; used prompt engineering (system prompts, few-shot examples, temperature tuning, output formatting) to power LLM-driven endpoints.
- Implemented tool/function calling patterns enabling LLMs (Gemini, OpenAI-compatible) to autonomously invoke Git, database, and DevOps APIs as part of multi-step agent workflows.
- Integrated Pinecone vector database for RAG-based context retrieval in the ChatOps Engine project.
- Designed normalized MySQL schemas; improved query performance ~40% via indexing and refactoring.
- Wrote JavaScript (ES6+, async/await) for n8n Code nodes and REST API consumption in frontend tasks; built and maintained HTML5/CSS3 UI components.
- Used Git daily — branching, pull requests, and code reviews in a collaborative team repository.
- Leveraged Cursor and GitHub Copilot daily to accelerate development and maintain code quality.
- Engineered an end-to-end blog generation workflow with n8n and Google's AI that minimizes production time by automating research, humanized drafting, image generation, and scheduled publishing.
- Architected an automated document extraction pipeline using n8n and Google's Vision AI to process scanned newspaper PDFs and deliver structured keyword summaries via the Telegram API.
- Promoted to R&D Head & Tech Lead (Feb–Jul 2025)** — led two parallel project teams across Python and automation workstreams, mentored junior developers and interns, defined technical architecture for new AI initiatives, and managed end-to-end delivery for US-based clients via Slack and video calls.

Data Analyst Intern — Unified Mentor

Feb 2026 – Present — Remote

- Analyzing datasets using Python and SQL for business reporting and data pipeline tasks.

Key Projects

AI-Powered ChatOps Engine (Multi-Agent + RAG)

Built a multi-agent system that eliminated manual DevOps, database, and Git operations by enabling developers to execute them via natural language commands in Mattermost — reduced manual developer workflow time by ~8 hours/week across the team. Architected 5 autonomous agents (GitOps, DBOps, DevOps Terminal, AI Receptionist, Credential Vault) each with dedicated system prompts, few-shot examples, and structured output formatting. Implemented LLM tool/function calling so agents autonomously invoke Git, database, and infrastructure APIs without human intervention. Integrated Pinecone vector database for RAG-based context retrieval enabling accurate company-specific responses. Deployed on Ubuntu with Docker and Nginx; secured credential access with hashing, reversible encryption, and RBAC audit logging.

Autonomous GenAI Voice Agent

Developed a fully automated AI voice system that handled end-to-end client interactions — inbound appointment scheduling and outbound lead qualification — with zero human operator involvement, eliminating 100% of manual follow-up calls. Built outbound agent using Twilio for calling and ElevenLabs for human-like voice synthesis, trained on company context to qualify leads against budget criteria and trigger WhatsApp and email follow-ups automatically via n8n. Inbound agent functioned as a virtual receptionist — checked team availability, booked appointments, generated Google Meet links, and sent instant confirmations via WhatsApp and email. All interaction data logged securely. *Stack: Twilio, ElevenLabs, n8n, Python, Gmail API, Google Calendar API.*

AI-Powered WhatsApp Automation System

Built a zero-cost intelligent WhatsApp communication system that auto-replied to leads 24/7, scheduled follow-up messages, and booked appointments — reducing manual response time from hours to seconds. Used Selenium for WhatsApp Web session management with multi-profile support and real-time unread message detection. Integrated Google Gemini AI for intelligent response generation, a custom knowledge base for domain-specific queries, and Google Calendar for availability-based appointment confirmation. MySQL backend managed scheduled messages, follow-up queues, and media delivery (text, image, file). Built PHP-based management UI for scheduling, tracking, and delivery logs. Handled 6 concurrent WhatsApp sessions in production on a single Ubuntu server.

Asstha — Enterprise RBAC & Project Management System

Complete backend for a multi-department project tracking system managing 40-50 concurrent projects. Built RBAC with 5 user roles, department workflow APIs, real-time task tracking, document routing across 4 approval levels, and performance reports (PDF/Excel/CSV). Managed full project lifecycle for 8 months including client presentations and team coordination. *Stack: Python, Flask, MySQL, Jenkins, Ubuntu.*

SecureVault — Python Desktop Encryption Application

Built a stealth Windows security application combining military-grade file encryption, secure wiping, and forensic resistance — designed for users handling sensitive data who need plausible deniability. AES encryption renames files with misleading extensions and removes originals, making recovery impossible without the key. Multi-pass wipe module overwrites free disk space using Normal (3x), Hard (6x), or Military (12x) algorithms to prevent forensic recovery. Application masquerades as a trusted executable (e.g. Firefox icon) requiring a custom passcode to unlock. Built hybrid UI using PyQt and Tkinter; supports multi-destination encrypted backups and system-bound license activation. *Stack: Python, AES, PyQt, Tkinter, Windows API.*

Cortex — Full-Stack Backend System

Designed and deployed complete backend infrastructure for a live mobile application and admin panel serving production traffic. Engineered 18+ RESTful API modules (9 mobile + 9 admin + 2 admin-exclusive) covering all core business operations including user management, data processing, and reporting. Implemented JWT authentication and session handling for secure access across all endpoints. Built PDF generation using PDFKit and automated email delivery via SMTP. Designed fully normalized relational database schema from scratch with advanced SQL JOINS optimized for performance. Delivered full API documentation including endpoint definitions, request/response formats, error models, and exception handling flows. *Stack: Python, Flask, MySQL, Gunicorn, Nginx, Ubuntu.*

Certifications & Recognition

- Star Performer of the Year 2024 — VedikIn Solutions
- Gemini for Google Cloud Learning Path — Google
- Accelerate App Development with Gemini CLI — Google
- Google AI Essentials — Google
